

LumenRadio, technology leader in wireless lighting control, is proud to announce a partnership with RC4 Wireless, manufacturer of wireless lighting and motion control systems for theatre, film and television. RC4 has integrated LumenRadio's CRMX wireless OEM modules into RC4's new LumenDim3 to offer low voltage dimming and control with unrivaled reliability and performance.

Using state-of-the-art technology to squeeze more power and features into a remarkably tiny package; LumenDim3 is ideal for RGB LED dimming, low-voltage incandescent, solenoids, relays and even motors. Dimmers are 16-bit (65,535 steps) and deliver an extremely smooth inverse-square-law (ISL) curve to make LED's look great across the entire dimming range. LumenDim3 is the first low voltage dimmer to offer extensive wireless RDM support. Using any RDM controller, including LumenRadio's acclaimed CRMX SuperNova software a wide range of parameters can be controlled and monitored.

"The LumenDim3 is a new class of RC4 product, explains **James David Smith**, president and chief product designer at RC4. I am particularly proud of our new digital circuit breaker technology. Protection is provided by a combination of self resetting hardware and expertly crafted firmware instead of a physical fuse that requires replacement. Response is faster than a traditional fuse and you can fine-tune the characteristics to optimize the protection of your load. This is a real breakthrough in safety and ease of use".

"LumenRadio is happy to add RC4 Wireless to our growing family of OEM partners that have chosen to integrate the CRMX technology into their products. We have enjoyed working with James over the last year and see LumenDim3 as a great complementary product to our own product range. Several large theaters are already adding LumenDim3 to their existing CRMX wireless installations", explains **Anders Ardstål**, VPO of LumenRadio.
